

Infrastructure for tokenized markets.

Spin up your own market for any tokenized asset. Microsecond matching, real-time settlement, and a signed trade journal anyone can verify end to end.

LEDGERS LIVE	OPERATORS	TRADING PAIRS	24H VOLUME

■ 02 / WHAT IT SOLVES FOR — move value across ledgers, on your terms

01 — MOBILITY

Liquidity that isn't trapped.

Move any tokenized asset to where it needs to be — pair anything across any ledger and settle the moment it's matched. No custodial bridges, no wrapped IOUs.

02 — SOVEREIGNTY

Trust you own, not rent.

Run your own market on your hardware, keys, and policy — instead of renting trust from a centralized exchange or a black-box bridge.

03 — PROOF

An answer for every fill.

Account for every fill yourself: one canonical, replayable history with a signed receipt per trade — disclose exactly what's needed, to whoever needs it.

■ 03 / CAPABILITIES — your stack, your terms

i / Operate

Run the stack yourself.

Your hardware, signed releases, remote attestation — what you deploy is what you audited.

ii / Trade

Trade anything tokenized.

Pair any asset across any ledger. No custodial bridges, no rehypothecated wrappers.

iii / Integrate

Plug into your workflow.

Drop the SDK into any terminal, bot, or treasury flow. gRPC, REST, TypeScript-first.

iv / Partner

Build it with our team.

White-glove onboarding and custom market design with a direct line to the team.

■ 04 / FROM INTENT TO RECEIPT

01 Match.

Signed intents enter a shared mempool. The engine resolves pairs across ledgers in microseconds, never touching custody.

02 Settle.

Fills settle directly against verifying contracts on origin and destination — value moves the moment the match is signed.

03 Report.

Every fill emits a signed journal entry — engine version, attestation, route, latencies. Disclose any window on demand.

■ 05 / OPERATOR SETUP — a guided, clickable flow. No CLI required.

01	Deploy the infrastructure — pick a cloud provider or run on-prem.	Select venue →
02	Deploy the vault smart contracts — push verifying vaults to your chains.	Deploy vaults →
03	Configure parameters and access — set trading + fee params, signers, permissions.	Configure →
04	Token registration — define what's traded and the settlement chain & token.	Add tokens →
05	Launch the market(s) — open order books and start routing intents.	Go live →

Connect. Deploy. Trade.
